Suicide as Public Health Problem

- 34,598 deaths in the US (2007)
- 90% of suicides associated with psychiatric illness
- 3rd leading cause of death of young people
  - 11th leading cause overall

Context
- 14,831 homicide deaths in US (2007)
- Greater than all but 3 types of cancer deaths

National Vital Statistics Reports, 58(19)
# US Prevalence Suicidal Behavior (Adults)

<sup>1</sup> Army Health Promotion Risk Reduction Suicide Prevention Report 2010 (AHPR/RR/SP) July 28, 2010
Hypotheses/Explanations for Higher Rates

- Effects of multiple deployments and combat
- Population changes: ↑ in new enlistees receiving entry waivers + a ↓ in separations
- Increased risk taking behavior across wider service
- PTSD, Depression, TBI, mTBI/concussion effects
- Substance misuse (alcohol, illicit & prescription drugs)
- Quality of care issues: screening, identification and referral, transitions of care
- Stigma associated with seeking help
- Rotation/Force Generation effects on cadre building and in-garrison supervision/mentoring
Suicidal Thoughts and Behaviors Past Year (2008) in Adults, by Past Year Substance-Use Disorder

Source: 2008 Substance Abuse and Mental Health Services Administration (SAMHSA) National Survey on Drug Use and Health (NSDUH)
Medical Problem/Threats

- Suicide rates have risen among Soldiers and Marines
- Pre-deployment training not validated to demonstrate training actually prevents or reduces suicides or suicidal behavioral
- Lack of validated screening measures for those at high risk of suicide
- Lack of effective treatments (psychotherapy and medication) to treat service members who are suicidal
- Lack of effective care management and follow-up treatment guidelines for behavioral health providers to follow
US Army Medical Research and Materiel Command (USAMRMC)

MISSION

Provide medical knowledge and materiel lifecycle management to protect, treat and optimize Warfighter health and performance across the full spectrum of operations.

VISION

We are the world’s experts and leaders in the military relevant biomedical research and medical materiel communities, delivering the best medical solutions to enhance, protect, treat, and heal our Warfighters.
Mission: Develop effective medical countermeasures against combat and operational stressors to maximize Warrior health, performance and fitness

**PSYCHOLOGICAL HEALTH AND RESILIENCE**

**THREATS**
- Posttraumatic Stress Disorder
- Suicide Behavior
- Concussion (mTBI)
- Alcohol/Other Drug Use Problems
- Co-occurring Mental Disorders
- Access/Retention in Behavioral Health Care
- Family Transitions and Stressors

**INJURY PREVENTION AND REDUCTION**

**THREATS**
- Acoustic Trauma
- Blast Overpressure
- Blunt Head and Body Trauma
- Traumatic Brain Injury
- Face, Eye and Spinal Cord Injury
- Musculoskeletal Injury
- Toxic Gas Inhalation
- Laser Eye Injury

**PHYSIOLOGICAL HEALTH**

**THREATS**
- Malnutrition
- Dehydration
- Sustained Fatiguing Work (Physical/Mental)
- Sleep Deficit & Circadian Desynchrony
- Distributed/Continuous Operations
- Dietary Supplements

**ENVIRONMENTAL HEALTH AND PROTECTION**

**THREATS**
- Toxic Industrial Chemicals and Materials
- Dust and Air Pollution
- Altitude and Hypoxia
- Cold Stress AND Heat Stress
- Protective Equipment/Clothing
Suicide Prevention Medical Research Continuum of Care

**RESEARCH NEEDS**

1. **Basic Science / Neurobiological Mechanism**, 2 studies***
   - Evidenced-based Suicide Prevention Training
   - Population-based Training
   - Leader Training
   - Selective Indicated Training

2. Epidemiology / Army STARRS, and 1 study $61.96 M
   - Selection, Resilience Training
   - Validated Pre-Deployment Training
   - Validated Leader Training

3. **Prevention / Education & Training**
   - Screen & Referral
   - Early Selective Identification Screen & Referral

4. **Early Screening / Intervention**
   - Screening Assessment (Pre-/Post-Deployment)
   - Unit Level Screening

5. **Risk Assessment**
   - Validated Risk Assessments
   - Imaging & Biomarkers
   - Impact of Co-morbidities

6. **Treatment**
   - Clinical Practice Guidelines
   - Effective Medications
   - Cognitive & Behavioral Interventions

7. **Recovery and Return to Duty**
   - Recovery Protocols
   - Evidenced-based System of Care Models
   - RTD Standards

8. **Postvention**
   - Postvention Care for Service Members and Families
   - Rescreening
   - Unit Support

**Research Highlights**

- Evidenced-based Suicide Prevention Training
- Population-based Training
- Leader Training
- Selective Indicated Training

- Validation of Screening Measures
- Early Selective Identification Screen & Referral

- Evidenced-based Clinical Assessments
- Validated Protocol to Identify High Risk Individuals

- Inpatient/Outpatient Psychotherapies
- Medications
- Follow-up Care for Suicide Attempters / High Risk Patients

- Evidenced-based System of Care Models
- Postvention Care

**Solutions**

- Effective Prevention and Training Practices
- Validated Screening Measure
- Identification of High Risk Individuals
- Evidenced-based Treatment Strategies
- Evidenced-based Recovery Models

Army Study to Assess Risk & Resilience in Service members (Army STARRS)

- Collaboration between NIMH and the Army
- Epidemiologic study of mental health, psychological resilience, suicide risk, suicide-related behaviors, and suicide deaths in the U.S. Army
- Largest study of suicide and mental health among military personnel ever undertaken
- Goal: Identify, as rapidly as possible, risk and protective factors to assist Army in developing effective strategies for mitigating Soldiers’ suicide risk

Clinical & Neurobiological Aspects of Suicide
Current Research Gaps

- Evidence-based universal prevention (e.g., peer based, family based, community based, military-ecologically based)
- Psychometrically sound, theory-driven screening measure(s)
- Basic science validating underlying psychological and biopsychosocial theories of suicide
- Focused methodological treatment studies: theory-driven & evidence-based; inpatient and outpatient (i.e., Cognitive behavioral Therapy [CBT], Cognitive Therapy [CT], Dialectical Behavioral Therapy [DBT], Interpersonal Therapy [IPT])
Other evidence-based indicated interventions to prevent and manage suicide behavior (e.g., caring outreach, collaborative assessment and management, safety planning, collaborative care models, etc.) across clinical care settings (e.g., ED, BH, Primary Care, etc.)

Combined psychotherapy and pharmacotherapy treatment studies
Research Gaps

- Effects of brief interventions to reduce problem drinking on suicide behavior and other outcomes (e.g., accidents, homicide, intimate partner violence)

- Systems approaches integrating brief evidence-based intervention to reduce problem alcohol or drug use in the primary care setting (e.g., enhanced RESPECT-MIL)

- Evidence-based systems of care to manage at-risk individuals (e.g., processes, health database mgt., technologies)

Welcome to the Military Suicide Research Consortium Project

The $17 million Consortium is part of an ongoing strategy to integrate and synchronize U.S. Department of Defense and civilian efforts to implement a multidisciplinary research approach to suicide prevention. Funded through the Military Operational Medicine Research Program (MOMRP), this innovative cutting-edge research aims to enhance the military’s ability to quickly identify those at risk for suicide and provide effective evidence-based prevention and treatment strategies.

CORE A

MSRC Executive Management

The Executive Management Core (Core A) has the ultimate responsibility for ensuring that the MSRC's overall mission is accomplished successfully, with proper vision and oversight. This Core facilitates and evaluates the operation of the MSRC, including supervising the operation of the other three Cores, the training of pre-doctoral and postdoctoral scholars, and the research program. Core A (in conjunction with Core B) coordinates public relations activities to alert the public to suicidal behavior as a massive public health problem, and to explain how the activities of the MSRC are striving to address the problem in the military. Core A is also charged with developing procedures for publication and data dissemination. This Core manages dispute resolution related to these areas. Importantly, Core A coordinates the external review of MSRC activities through an external advisory panel.
Core A: Executive Management Core

- Responsible for ensuring that the mission is accomplished successfully
- In conjunction with Core B, coordinates public relations activities
- Develops procedures for publication and data dissemination
- Oversee disclosure of conflict of interest
Additional Elements of Core A

Military External Advisory Board (MEAB)
- representatives from all branches, VA and civilian experts
- establish initial gaps in the literature on military suicide to be filled by the research program
- identifying research program members and outside collaborators

Peer Review Program
Core B: Information Management/Scientific Communications

- Responsible for disseminating consortium knowledge, information and findings
- Rapid response to queries
- Creates and uses controlled vocabularies to ensure accurate searching
- Technical assistance and support for decision makers
- Warehouses knowledge about suicidal behavior
Core C: Military/Civilian Research Monitoring

- Monitors current military and civilian research
- Works with MEAB for input to address gaps in research
- Contacts authors to request information about ongoing research
- Ensures that all aspects of the Consortium are relevant and sensitive to military-related issues
Core D: Database/ Statistical Management

- Coordinates and assures quality of data collection, data management and data analyses across Consortium
- Provides support to research projects in the development of tools
- Monitors the accuracy and confidentiality of all collected data, ensuring data safety is provided
- Facilitates communication and sharing data, using a Progress Monitoring and Reporting Network (PMRN)
- Constructs a uniform database structure (UDS) across projects

Dear __________,

It has been some time since you were here at the hospital, and we hope things are going well for you. If you wish to drop us a note we would be glad to hear from you.

Sincerely,
Two Possible Mechanisms for Change

1) Social isolation: a strong and consistent risk factor for suicide. Joiner proposes it is an observable indicator that a fundamental human need is unmet – the need to belong.

Over 40 studies confirm the importance of “thwarted belongingness” in predicting suicidal behavior.

Caring contacts may improve a sense of belonging and through this, the desire to live.

2) It has also been hypothesized that caring contacts work because they lead to a more positive attitude toward the behavioral health system, which increases utilization of outpatient (OP) services, which decrease suicidal behavior.
Aims / Hypotheses

• Aim 1: Determine if the addition of 12 months of CCVT + TAU results in lower rates of suicidal ideation and behavior relative to TAU alone
  • 1a: Reduced suicidal ideation at 12 months
  • 1b: Fewer suicide risk incidents (i.e., those requiring medical evacuation or hospital admission) per participant over 12 months
  • 1c: Fewer total # of suicide risk incidents over 12 months

• Aim 2: Test two proposed mechanisms of action of CCVT outcome: 1) reduced “thwarted belongingness” and 2) increased engagement in behavioral health services
  • 2a: The effect of CCVT compared to TAU will be mediated by reductions in “thwarted belongingness” from pre to post-study
  • 2b: The effect of CCVT compared to TAU will be mediated by increased use of OP behavioral health services in CCTV condition

A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans: A Randomized Controlled Study

Rebecca Bernert, Ph.D.
Department of Psychiatry and Behavioral Sciences
A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans

The overarching aim of this proposal is to develop and test a behavioral sleep intervention to prevent suicidal behaviors among OEF/OIF veterans in a randomized controlled study.
A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans

Growing evidence that suggests that sleep disturbance may be an important, modifiable risk factor for suicide

- Disturbed sleep is modifiable
- Poor sleep is amenable to treatment
- Low-risk intervention targeting high-risk sample
- Sleep problems are less stigmatizing
- Research tested interventions are scarce
A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans

Primary Aim 1: To develop and test an integrated, manualized behavioral sleep intervention for suicidality, MSPI (Military sleep-based preventive intervention) for suicidal behaviors

Primary Aim 2: To examine MSPI effects in lowering suicidal ideation and behavior compared to a control treatment

Secondary Aim 3: To examine MSPI effects on improving sleep indices (insomnia, sleep variability, nightmares, poor sleep quality) compared to control

Secondary Aim 4: To explore MSPI effects on improving mood and stress measures

Secondary Aim 5: To explore if mood or stress indices mediate or moderate MSPI suicidality reductions in treatment
A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans

- Proposed integration of two efficacious behavioral therapies:
  - CBT for Insomnia (CBT-I) will address insomnia, poor sleep quality, and sleep variability;
  - Imagery Rehearsal Treatment (IRT) will address residual nightmare symptoms.

- RCT: N=60 per arm:
  - MSPI
  - Pseudo-Desensitization Treatment for Insomnia (DTI)

- Recruitment at VA Palo Alto Health Care System
A Behavioral Sleep Intervention for Suicidal Behaviors in Military Veterans

Researchers hypothesize that, compared to a control condition, the active intervention will produce significant post-treatment reductions in:

1. suicidal ideation and suicide attempts (primary hypothesis),

2. sleep indices: insomnia, poor sleep quality, and nightmares (secondary hypothesis).
Usability and Utility of a Virtual Hope Box (VHB) for Reducing Suicidal Ideation

Nigel Bush, Ph.D.
National Center for Telehealth & Technology
University of Washington
Virtual Hope Box

Develop and conduct initial proof of concept testing of a Virtual Hope Box app as an alternative to conventional hope kit used in Cognitive Therapy (CT) and Dialectic Behavior Therapy (DBT).
Hope Boxes

A common strategy to cope with suicidal ideation and behavior is the creation of a Hope Box which usually consists of items that are life-affirming.
Hope Boxes

Potential Coping Tools used in Hope Boxes
- Names, phone numbers of supportive people
- Inspirational texts
- Pictures
- Videos
- Positive Experiences
- Distractions
- Relaxation tapes/ tools
- Instructions on Guided Imagery
Virtual Hope Box (VHB)

- Provide real-time access to stress management tools aimed at increasing positive affect and highlighting Reasons for Living (RFLs).

- Include multimedia features such as support contact information, voice or video memos from important others, inspirational text, electronic coping cards, distracting stimuli, and audiovisual relaxation coaching.
Researchers hypothesize that
- the VHB will demonstrate high usability (e.g., easy to learn, efficient and convenient to use)
- that patients will use the VHB more than a traditional “physical” hope box (PHB),
- that the VHB will demonstrate high patient acceptability and satisfaction.
- that users will prefer the convenience, easy utility, content richness, and hip-pocket portability of the VHB to the more static, cumbersome, and immobile PHB.
Virtual Hope Box

Phase 1: Prototype development & testing

- Translate design specifications into a working prototype
- Conduct usability testing
  - 20 active duty service members
  - Joint Base Lewis McChord (JBLM)
- Modify and improve the initial prototype based on feedback
Virtual Hope Box

Phase 2: Clinical Proof of Concept Testing

- Pilot with 10 high-risk-of-self-harm Veterans
- VAMC Portland Mental Health Clinic
- Data collected
  - semi-structured interviews
  - electronic usage log
  - PHB & VHB Usability Questionnaire
  - Clinical in-person debrief
  - Clinician focus groups
  - Psychological Outcomes
Brief Intervention for Short-Term Suicide Risk Reduction in Military Populations

Craig J. Bryan, PsyD
University of Texas Health Science Center
San Antonio
Brief Intervention for Short- Term Suicide Risk Reduction in Military Populations

This study’s main objective is to identify the most effective intervention for reducing short term risk for suicide attempts in “real world” military settings and to identify potential mechanisms of change underlying the interventions’ impact on subsequent suicide attempts.
Brief Intervention for Short-Term Suicide Risk Reduction in Military Populations

Crisis Response Plan:

* Commonly used for short term management of suicide risk
* Includes early warning signs of a crisis
* Identifies self-management skills to reduce distress
* Identifies social supports
* Provides crisis management resources

CRP+RFL

* All of the above
* Identification and rehearsal of personal reasons for living
Brief Intervention for Short-Term Suicide Risk Reduction in Military Populations

Cognitive fluidity (aka “tunnel vision”) is a hallmark feature of suicidality.

Hopelessness entails the inability to recognize positive alternatives.

Reasons for Living (RFL) can buffer an individual considering suicide.

By increasing the detail and emotional attachment to the items on the RFL, cognitive limitations that contribute to overgeneralized memory and slow recall can be overcome.
Researchers Hypothesize:

- The crisis response plan with reasons for living (CRP+RFL) intervention will contribute to significantly decreased risk for suicide attempts and hospitalization during follow-up relative to the crisis response plan alone (CRP) and treatment as usual (TAU).

- The CRP+RFL intervention will contribute to greater ambivalence about suicide and faster recall of reasons for living relative to the CRP and TAU interventions.

- Greater ambivalence about suicide and faster recall of reasons for living will mediate the relationship between intervention and reduced risk for suicide attempt during follow-up.
Brief Intervention for Short- Term Suicide Risk Reduction in Military Populations

Randomize 360 military personnel (Fort Carson, Colorado)
- TAU
- CRP
- CRP+RFL

Assessments
- Baseline (Pre-intervention) assessment: self-report and clinician-administered baseline assessments
- Post-intervention assessment: self-report measures immediately following the intervention, prior to their final disposition.
- Follow-up assessments: self-report and clinician-administered follow-up assessments at 1 week, 1 month, and 6 months following the baseline assessment.
Development and Evaluation of a Brief, Suicide Prevention Intervention Reducing Anxiety Sensitivity

Norman B. Schmidt, Ph.D.

Florida State University
Anxiety Sensitivity: a fear of arousal

Anxiety sensitivity (AS) has been linked to a variety of problems including suicidal ideation. By targeting and treating AS, it is hypothesized that suicidal behaviors among military personnel will decrease.

The Cognitive Anxiety Sensitivity Treatment (CAST) intervention was developed to model psychoeducation and common behavioral techniques used in treatment of individuals experiencing anxiety disorders.

This intervention will be created into a web-based application, making it portable and accessible worldwide. CAST will also be designed to be implemented at any point in a service member’s career, allowing CAST to reach the entire military population.
Development and Evaluation of a Brief, Suicide Prevention Intervention Reducing Anxiety Sensitivity

The Researchers Hypothesize:

- **Cognitive Anxiety Sensitivity Treatment (CAST)** will reduce overall AS and Cognitive AS in military, veteran and other relevant samples (e.g., individuals with PTSD).
- CAST will reduce suicidal ideation and risk for suicidal behaviors.
- CAST will have a positive impact on other adverse outcomes associated with elevated AS including PTSD and substance use.
- CAST will impact emotional TBI sequelae.
Development and Evaluation of a Brief, Suicide Prevention Intervention Reducing Anxiety Sensitivity

- **Phase I** will include the modification of the existing AS reduction protocol and application development.

- **Phase II** will include piloting the application on a relevant sample (N=10-20) to solicit feedback and may result in further modifications to the application.

- **Phase III** will include a RCT (N=70) designed to provide evidence of efficacy for the intervention along with platform conversion of the application. (funding of phase III pending revisions)
The proposed research will take place across three primary performance sites:

- FSU: Primary research site
- NCPTSD/ VA Boston: secondary research site primarily responsible for the recruitment of military veterans
- Infinity Software Development Inc: secondary research site dedicated to software development
MSRC Project Deliverables

- Development of comprehensive approach to preventing suicide among Military Service members and Veterans ensuring scientific basis exists to support suicide risk screening, assessment, prevention efforts, and interventions

- Creation of infrastructure for decision-makers and public for reliable information on questions regarding suicide and suicidal behavior in the military and Veterans

- Expanding knowledge, understanding, and capacity to prevent, treat, and enhance quality of life for those in military communities and the general public affected by suicide and suicidal behavior
Dissemination/Transition Plan

- Website: www.msrc.fsu.edu

- Journal articles and books

- Renewal of consortium after first phase
